Asset Integrity Report

STATUS: PHYSICAL OBSERVATIONS RECORDED; CAUSATION UNDETERMINED

Note from Nano and Mega: Hey! Based on the previous consensus, we went back to the arcade machine in question and conducted a bunch of miscellaneous physical examinations to assess the external damage following the voltage spike on the 23rd. There's a lot of details to go through, so take your time. Just a heads up, **none of this data seems conclusive or supplies valuable evidence**, as far as we could tell. Maybe you computer guys could figure something out? **Don't bash your heads over it though!**

1. General Condition

A preliminary physical inspection of The Reckoning V: Origins was conducted following the reported operational irregularities. The machine remained identifiable and structurally intact at the time of inspection. No evidence of catastrophic structural failure, major enclosure displacement, or widespread fragmentation was recorded during the visual assessment. The external housing exhibited several minor surface irregularities, including localised scuffing near the lower access panel, superficial abrasions along the right-side casing, and a small area of discolouration adjacent to a ventilation opening. These findings were confined to the exterior surfaces and did not, on visual examination alone, establish damage to any internal assembly.

2. Recorded Physical Observations

The following conditions were documented during the inspection:

a. Enclosure surface damage: Fine scratches and shallow abrasions were observed on the outer casing. Their distribution was irregular, and no distinctive pattern was identified that would establish a particular impact direction or mechanism.
b. Access-panel alignment: A slight, visually perceptible offset was noted along one edge of the lower access panel. The panel remained attached, and no conclusion regarding interference with internal components could be drawn from its external position alone.
c. Ventilation grille: A small accumulation of dust and fibrous debris was present along portions of the ventilation grille. No verified airflow restriction or associated thermal consequence was established.
d. Surface discolouration: Localised darkening was observed near one ventilation aperture. The material's composition and the origin of the discolouration were not determined. The observation cannot independently be classified as evidence of overheating, combustion, or electrical arcing.
e. Fastener condition: Minor cosmetic wear was visible around two externally accessible fastener heads. No verified loss of fastening integrity or corresponding structural instability was recorded.

Asset Integrity Report

3. Correlation with Electrical Observations

The physical findings do not independently establish a connection with the electrical irregularities documented in the accompanying report. In particular, the recorded compressor-controller startup and elevated harmonic content remain observations of undetermined significance. No verified physical evidence currently links either observation to the enclosure abrasions, surface discolouration, or panel misalignment.

Similarly, no specific physical defect was identified as the initiating cause of the reported operational event. The available observations are insufficient to determine whether the superficial conditions predated the incident, developed during normal operation, or arose in connection with the event itself.

4. Preliminary Assessment

The inspection documented limited external wear and several minor surface anomalies. Within the scope of the preliminary visual assessment, no major external structural failure was established. The condition of concealed components, internal supports, electrical insulation, and load-bearing assemblies remains unverified and should not be inferred from the exterior findings.

5. Conclusion

The physical inspection produced a record of superficial enclosure irregularities but did not establish a specific mechanical failure, a causal sequence, or a definitive relationship between the observed surface conditions and the reported electrical anomalies. All findings remain preliminary and are limited to the conditions actually documented during inspection.

Photo 1: External casing exhibiting superficial abrasions and localised surface discolouration near the ventilation assembly.

Photo 2: Lower access-panel junction showing minor alignment irregularities and cosmetic wear around the exposed fasteners.
